

Supplementary Table 1. Haploid matings, genotypes, and selection conditions.

MAT_a Genotype	MAT_α Genotype	Selection
SK1 pRS414 – Cas9	SK1 ade2::gRNA (gene drive), pRS413	SC-histidine - tryptophan
SK1 ade2::gRNA + URA3 (gene drive), p414-Cas9	SK1 pRS413	SC-histidine - tryptophan
SK1 p414-Cas9	SK1 abd1::ABD1 recoded +gRNA (gene drive), pRS413	SC-histidine - tryptophan
Y12A Hygromycin B resistance (HygR)	SK1 ade2::gRNA (gene drive), p416-Cas9	SC-uracil+300 ug/mL Hygromycin B
YPS128 Hygromycin B resistance (HygR)	SK1 ade2::gRNA (gene drive), p416-Cas9	SC-uracil+300 ug/mL Hygromycin B
YJM981 Hygromycin B resistance (HygR)	SK1 ade2::gRNA (gene drive), p416-Cas9	SC-uracil+300 ug/mL Hygromycin B
Y55 Hygromycin B resistance (HygR)	SK1 ade2::gRNA (gene drive), p416-Cas9	SC-uracil+300 ug/mL Hygromycin B
UWOPS05-217.3 Hygromycin B resistance (HygR)	SK1 ade2::gRNA (gene drive), p416-Cas9	SC-uracil+300 ug/mL Hygromycin B
DBVPG 6044 Hygromycin B resistance (HygR)	SK1 ade2::gRNA (gene drive), p416-Cas9	SC-uracil+300 ug/mL Hygromycin B
273614N Hygromycin B resistance (HygR)	SK1 ade2::gRNA (gene drive), p416-Cas9	SC-uracil+300 ug/mL Hygromycin B
SK1 ADE2:: ADE2 silently recoded genomic target seed sequence, p414-Cas9	SK1 ade2::gRNA (gene drive), pRS413	SC-histidine - tryptophan
SK1, p414-empty	SK1 ade2::gRNA (gene drive), pRS413	SC-histidine - tryptophan
BY4723 ADE2 recoded	SK1 ade2::complete gene drive (Cas9+gRNA,with recoded ADE2 target)	SC-histidine - tryptophan
BY4723	SK1 ade2::complete gene drive (Cas9+gRNA,with recoded ADE2 target)	SC-histidine - tryptophan
Complete Gene drive Haploid from dissected tetrad, p413-empty	SK1 ADE2 +reversal gene drive (Cas9+gRNA, targeting inserted orthogonal target), p416-empty	SC-histidine -uracil

Supplementary Note

In order to spread through a population, the inheritance advantage provided by a gene drive must outweigh the fitness cost imposed. For example, an RNA-guided gene drive that imposes no fitness cost to a sexually reproducing organism and is perfectly copied upon fertilization will be inherited twice as often as a non-driving gene when rare. But if the drive imposes a fitness penalty of 50%, it will be fitness neutral under the same circumstances: although inherited twice as often, carriers will on average produce only half as many offspring.

For drives spreading through populations that frequently reproduce asexually, the fitness cost must be considerably lower because the inheritance advantage is only realized during sexual reproduction, while the cost also applies to asexual generations. For example, if *S. cerevisiae* reproduces sexually at a frequency comparable to the related *S. paradoxus* in the wild, e.g. only once for every 1000 asexual generations, the fitness cost can presumably be no more than 0.1%³¹. The ability of a synthetic endonuclease-based gene drive element to spread through wild populations of organisms that frequently reproduce asexually is consequently much reduced. Counterintuitively, natural homing endonucleases are most often found in organisms that frequently reproduce asexually. Following Burt and Koufopanou, this may be because rapid fixation of such an element is an evolutionary disadvantage over the long term due to the loss of selective pressure for continued function and subsequent degradation³.
